

*In the Claims*

The status of claims in the case is as follows:

1       1. [Previously presented] A method for control and  
2       management of communication traffic, comprising the steps  
3       of:  
  
4       expressing access rules as filters referencing system  
5       kernel data;  
  
6       for outbound processing, determining source application  
7       indicia;  
  
8       for inbound packet processing, executing a look-ahead  
9       function to determine target application indicia; said  
10      look-ahead function being executed within a protocol  
11      stack including an IP layer, a transport layer, a  
12      sockets layer, and an application layer and which, for  
13      said inbound packet, said IP layer provides to said  
14      transport layer said inbound packet, marked as non-  
15      deliverable, and receives back from said transport  
16      layer indicia, provided to said transport layer by said

END920010019US1

2 of 39

S/N 09/919,185

17       sockets layer, identifying the application layer  
18       application to which said packet would have been  
19       delivered; and

20       responsive to said source or target application  
21       indicia, executing filter processing; said filter  
22       processing including constructing and evaluating  
23       logical expressions of arbitrary length, and  
24       selectively using a set of logical operators,  
25       alternative filter selector fields, and value set.

1       2. [Currently amended] The method of claim 1, wherein  
2       said protocol stack is a TCP/IP protocol stack, and further  
3       comprising the steps of executing said determining and  
4       executing steps within a kernel filtering function upon  
5       encountering a filter selector field referencing kernel data  
6       not included in said packet.

1       3. [Currently amended] The method of claim 1, wherein  
2       said protocol stack is a TCP/IP protocol stack, and said  
3       filter processing including the steps of:

4               determining a task or thread identifier;  
5               based on said task or thread identifier, determining a

END920010019US1

3 of 39

S/N 09/919,185

6 process or job identifier; and

7 based on said process or job identifier, determining  
8 job or process attributes for filter processing.

1 4. [Currently amended] The method of claim 1, wherein  
2 said protocol stack is a TCP/IP protocol stack, and said  
3 filter processing including the steps of:

4 determining a user identifier; and

5 based on said user identifier, determining user  
6 attributes for filter processing.

1 5. [Original] The method of claim 3, further comprising  
2 the step of determining from said task identifier a work  
3 control block containing said process or job identifier.

1 6. [Canceled]

2 7. [Canceled]

1 8. [Currently amended] The method of claim 1, wherein  
2 said protocol stack is a TCP/IP protocol stack, and further

END920010019US1

4 of 39

S/N 09/919,185

3 comprising the steps of:

4 delivering to said filters infrastructure access rules  
5 for defining security context.

1 9. [Original] The method of claim 8, said infrastructure  
2 including logging, auditing, and filter rule load controls.

1 10. [Previously presented] A method for control and  
2 management of aspects of communication traffic within  
3 filtering, comprising the steps of:

4 receiving IP packet data into a TCP/IP protocol stack  
5 executing within a system kernel;

6 for an inbound IP packet, executing a look-ahead  
7 function within a protocol stack including an IP layer,  
8 a transport layer, a sockets layer, and an application  
9 layer and which, for said IP inbound packet, said IP  
10 layer provides to said transport layer said inbound IP  
11 packet, marked as non-deliverable, and receives back  
12 from said transport layer indicia, provided to said  
13 transport layer by said sockets layer, identifying the  
14 application layer application to which said packet  
15 would have been delivered; and

END920010019US1

5 of 39

S/N 09/919,185

16           executing filtering code within said system kernel with  
17           respect to non-IP packet data accessed within said  
18           system kernel outside of said TCP/IP protocol stack;  
19           said filtering code constructing and evaluating logical  
20           expressions of arbitrary length, and selectively using  
21           a set of logical operators, alternative filter selector  
22           fields, and value set.

1       11. [Original] The method of claim 10, said non-IP packet  
2       data including context data regarding said IP packet.

1       12. [Original] The method of claim 10, said non-IP packet  
2       data including data specific to a task generating said non-  
3       IP packet data.

1       13. [Original] The method of claim 10, said non-IP packet  
2       data including data specific to a task that will receive  
3       said IP packet.

1       14. [Original] The method of claim 11, said context data  
2       including packet arrival interface indicia.

15. [Canceled]

16. [Canceled]

17. [Canceled]

END920010019US1

6 of 39

S/N 09/919,185

1       18. [Previously presented] A method for centralizing  
2       system-wide communication management and control within  
3       filter rules, comprising the steps of:

4           providing filter statements syntax for accepting  
5       parameters in the form of a selector, each selector  
6       specifying selector field, operator, and a set of  
7       values;

8           for an inbound packet, executing a look-ahead function  
9       within a protocol stack including an IP layer, a  
10      transport layer, a sockets layer, and an application  
11      layer and which, for said inbound packet, said IP layer  
12      provides to said transport layer said inbound packet,  
13      marked as non-deliverable, and receives back from said  
14      transport layer indicia, provided to said transport  
15      layer by said sockets layer, identifying the  
16      application layer application to which said packet  
17      would have been delivered by said sockets layer;

18           said selector referencing data that does not exist in  
19      IP packets;

20           processing said filter statements, including  
21      constructing and evaluating logical expressions of

END920010019US1

7 of 39

S/N 09/919,185

22           arbitrary length, and selectively using a set of  
23           logical operators, alternative filter selector fields,  
24           and value set.

1       19. [Currently amended] The method of claim 18, wherein  
2       said protocol stack is a TCP/IP protocol stack, and said  
3       parameters selectively including userid, user profile, user  
4       class, user group, user group authority, user special  
5       authority, job name, process name, job group, job class, job  
6       priority, other job or process attributes, and date & time.

1       20. [Currently amended] The method of claim 18, wherein  
2       said protocol stack is a TCP/IP protocol stack, and said  
3       filters statements being provided within a user interface to  
4       said system.

1       21. [Currently amended] The method of claim 18, wherein  
2       said protocol stack is a TCP/IP protocol stack, and further  
3       comprising the steps of:

4           establishing a tunnel between two IP address limiting  
5           traffic to applications bound to ports at each end of  
6           said tunnel;

7           said filtering code accessing filtering attributes

END920010019US1

8 of 39

S/N 09/919,185

8           further limiting traffic selectively to job indicia;  
9           and

10          operating said filtering code within a kernel filtering  
11         function upon encountering a filter selector field  
12         referencing kernel data not included in said traffic.

1           22. [Currently amended] A method for traversing a portion  
2         only of a protocol stack to disallow selective IP packet  
3         traffic, comprising the steps of:

4           receiving a packet in the kernel of the operating  
5         system of a first node from an application, said kernel  
6         including a filter processor; said filter processor for  
7         constructing and evaluating logical expressions of  
8         arbitrary length, said logical expressions selectively  
9         including a set of logical operators, alternative  
10        filter selector fields, and value set;

11          for inbound packet processing to a first node from a  
12         second node, executing a look-ahead function in the  
13         system kernel of said first node to determine a target  
14         application; said system kernel including a TCP/IP  
15         protocol stack including an IP layer, a transport  
16         layer, a sockets layer, and an application layer and

END920010019US1

9 of 39

S/N 09/919,185

17       which, for said inbound packet, said IP layer provides  
18       to said transport layer said inbound packet, marked as  
19       non-deliverable, and receives back from said transport  
20       layer indicia identifying the application layer  
21       application to which said packet would have been  
22       delivered;

23       for both said inbound packet processing, and for  
24       outbound packet processing from said first node to said  
25       second node, executing within said kernel the steps of  
  
26               processing said packet by determining a task ID;

27               responsive to said task ID, determining a  
28               corresponding work control block;

29               determining a user ID, process or job identifier  
30               from said work control block;

31               from the user ID, process or job identifier  
32               selectively determining attributes for said user  
33               process or job; and

34               passing said attributes to said filter processor  
35               for managing and controlling communication

36 traffic.

1 23. [Previously presented] A method for expressing access  
2 rules as filters, comprising the steps of:

3 providing a filter statements syntax for accepting  
4 parameters in the form of a selector, each selector  
5 specifying selector field, operator, and a set of  
6 values; and

7 said selector referencing data that does not exist in  
8 IP packets for controlling access to an application;

9 for an inbound IP packet, executing a look-ahead  
10 function within a protocol stack including an IP layer,  
11 a transport layer, a sockets layer, and an application  
12 layer and which, for said IP inbound packet, said IP  
13 layer provides to said transport layer said inbound IP  
14 packet, marked as non-deliverable, and receives back  
15 from said transport layer indicia, provided to said  
16 transport layer by said sockets layer, identifying the  
17 application layer application to which said packet  
18 would have been delivered; and

19 processing said filter statements by constructing and

20       evaluating logical expressions of arbitrary length,  
21       said logical expressions selectively including a set of  
22       logical operators, alternative filter selector fields,  
23       and value set referencing said application layer  
24       application.

1       24. [Previously presented] A method for managing and  
2       controlling communication traffic by centralizing access  
3       rules in filters executing within and referencing data  
4       available in system kernels, comprising the steps for  
5       outbound packet processing from a first node to a second  
6       node of:

7       receiving said packet in the kernel of the operating  
8       system of said first node from an application or  
9       process at said first node;

10      processing said packet by determining a task ID;

11      responsive to said task ID, determining a corresponding  
12      work control block;

13      responsive to said work control block, determining a  
14      process or job identifier;

15           responsive to said process or job identifier,  
16           determining job or process attributes; and

17           executing said filters by constructing and evaluating  
18           logical expressions of arbitrary length, said logical  
19           expressions selectively including a set of logical  
20           operators, alternative filter selector fields, and  
21           value set.

1       25. [Previously presented] The method of claim 24, further  
2       comprising the steps for inbound packet processing from said  
3       second node to said first node of:

4           initially operating said kernel at said first node to  
5           determine a target application for said packet at said  
6           first node by executing a look-ahead function within a  
7           protocol stack including an IP layer, a transport  
8           layer, a sockets layer, and an application layer and  
9           which, for said inbound packet, said IP layer provides  
10          to said transport layer said inbound packet, marked as  
11          non-deliverable, and receives back from said transport  
12          layer indicia, provided to said transport layer by said  
13          sockets layer, identifying the application layer  
14          application to which said packet would have been  
15          delivered;.

9 filter selector fields, and value set;

10 said filter processor responsive to an inbound packet  
11 for executing a look-ahead function for determining a  
12 target application; said look-ahead function operating  
13 within [[a]] said TCP/IP protocol stack including an IP  
14 layer, a transport layer, a sockets layer, and an  
15 application layer and which, for said IP inbound  
16 packet, said IP layer provides to said transport layer  
17 said inbound IP packet, marked as non-deliverable, and  
18 receives back from said transport layer indicia,  
19 provided to said transport layer by said sockets layer,  
20 identifying the application layer application to which  
21 said packet would have been delivered;

22 said filter processor responsive to both inbound and  
23 outbound packets for

24 processing said packet by determining a task ID;

25 responsive to said task ID, determining a  
26 corresponding work control block;

27 determining a user ID, process or job identifier  
28 from said work control block;

29                   from the user ID, process or job identifier  
30                   selectively determining attributes for said user  
31                   process or job; and

32                   passing said attributes to said filter processor  
33                   for managing and controlling communication  
34                   traffic.

1       40. [Previously presented] A system for expressing access  
2       rules as filters, comprising:

3                   filter statements for accepting parameters in the form  
4                   of a selector, each selector specifying selector field,  
5                   operator, and a set of values;

6                   said selector referencing data that does not exist in  
7                   IP packets for controlling access to an application;

8                   a look-ahead function executing within a protocol stack  
9                   including an IP layer, a transport layer, a sockets  
10                  layer, and an application layer and which, for an  
11                  inbound packet, said IP layer provides to said  
12                  transport layer said inbound packet, marked as non-  
13                  deliverable, and receives back from said transport  
14                  layer indicia, provided to said transport layer by said

15               sockets layer, identifying the application layer  
16               application to which said packet would have been  
17               delivered; and

18               a filter processor for constructing and evaluating said  
19               filter statements as logical expressions of arbitrary  
20               length, each said logical expression selectively  
21               including said operator selected from a set of logical  
22               operators, alternative filter selector fields, and  
23               value set.

1       41. : [Currently amended] A system for managing and  
2               controlling communication traffic by centralizing access  
3               rules in filters executing within and referencing data  
4               available in system kernels, comprising:

5               a computer readable medium;

6               first code for receiving a packet in the kernel of the  
7               operating system of a first node from an application or  
8               process at said first node; said kernel responsive to  
9               an inbound packet, for executing a look-ahead function  
10              within a TCP/IP protocol stack including an IP layer, a  
11              transport layer, a sockets layer, and an application  
12              layer and which, for said inbound packet, said IP layer

END920010019US1

24 of 39

S/N 09/919,185

13       provides to said transport layer said inbound IP  
14      packet, marked as non-deliverable, and receives back  
15      from said transport layer indicia, provided to said  
16      transport layer by said sockets layer, identifying the  
17      application layer application to which said packet  
18      would have been delivered;

19       second code for processing said packet by determining a  
20      task ID;

21       third code responsive to said task ID for determining a  
22      corresponding work control block;

23       fourth code responsive to said work control block for  
24      determining a process or job identifier;

25       fifth code responsive to said process or job identifier  
26      for determining job or process attributes;

27       sixth code for executing said filters by constructing  
28      and evaluating logical expressions of arbitrary length,  
29      said logical expressions selectively including a set of  
30      logical operators, alternative filter selector fields,  
31      and value set; and wherein

25 of 39

S/N 09/919,185

32           said first, second, third, fourth, fifth, and sixth  
33        code is recorded on said computer readable medium.

42. [Canceled]

1        43. [Previously presented] A system for control and  
2        management of communication traffic with respect to a system  
3        node, comprising:

4           a filtering function executing within a protocol stack  
5        of the system kernel of said system node identifying  
6        for an inbound packet a filter referencing non-packet  
7        data; and

8           a look-ahead function responsive to said filter for  
9        identifying a target application for said inbound  
10       packet; said look-ahead function functioning within a  
11       protocol stack including an IP layer, a transport  
12       layer, a sockets layer, and an application layer and  
13       which, for said inbound packet, said IP layer provides  
14       to said transport layer said inbound packet, marked as  
15       non-deliverable, and receives back from said transport  
16       layer indicia, provided to said transport layer by said  
17       sockets layer, identifying the application layer  
18       application to which said packet would have been

19 delivered;; and

20 a filter processor for constructing and evaluating  
21 logical expressions of arbitrary length, said logical  
22 expressions selectively including a set of logical  
23 operators, alternative filter selector fields, and  
24 value set.

44. [Canceled]

1 45. [Previously presented] A computer program product for  
2 control and management of aspects of communication traffic  
3 within filtering, said computer program product comprising:

4 a computer readable medium;

5 first program instructions to receive IP packet data  
6 into a TCP/IP protocol stack executing within a system  
7 kernel including, for processing an inbound IP packet,  
8 a look-ahead function within a protocol stack including  
9 an IP layer, a transport layer, a sockets layer, and an  
10 application layer and which, for said IP inbound  
11 packet, said IP layer provides to said transport layer  
12 said inbound IP packet, marked as non-deliverable, and  
13 receives back from said transport layer indicia,

14           provided to said transport layer by said sockets layer,  
15           identifying the application layer application to which  
16           said packet would have been delivered;

17           second program instructions to execute filtering code  
18           within said system kernel with respect to non-IP packet  
19           data accessed within said system kernel outside of said  
20           TCP/IP protocol stack by constructing and evaluating  
21           logical expressions of arbitrary length, said logical  
22           expressions selectively including a set of logical  
23           operators, alternative filter selector fields, and  
24           value set; and wherein

25           said first and second program instructions are recorded  
26           on said medium.

1       46. [Previously presented] A computer program product for  
2           centralizing system-wide communication management and  
3           control within filter rules, said computer program product  
4           comprising:

5           a computer readable medium;

6           first program instructions to execute filter statements  
7           having a syntax for accepting parameters in the form of

8           a selector, each selector specifying selector field, a  
9           logical operator selected from a set of a plurality of  
10          logical operators, and a set of values; and

11          second program instructions to cause said selector to  
12          reference data that does not exist in IP packets, said  
13          data including application layer indicia obtained for  
14          an incoming packet by a look-ahead function; said look-  
15          ahead function executing within a protocol stack  
16          including an IP layer, a transport layer, a sockets  
17          layer, and an application layer and which, for said IP  
18          inbound packet, said IP layer provides to said  
19          transport layer said inbound IP packet, marked as non-  
20          deliverable, and receives back from said transport  
21          layer indicia, provided to said transport layer by said  
22          sockets layer, identifying the application layer  
23          application to which said packet would have been  
24          delivered; and wherein

25          said first and second program instructions are recorded  
26          on said medium.

1       47. [Previously presented] A computer program product for  
2       managing and controlling communication traffic by  
3       centralizing access rules in filters executing within and
